Instagram post: “**manonidental** Patient requested a more permanent replacement for his plastic dentures, considering that the abutments were undergoing periodontal healing from root planeing, the best way to both provide a fixed prosthesis and to stabilize the adjacent abutments which were slightly mobile was to use @ribbon_dental fiber. This was a single visit fiber reinforced composite replacing lower central incisors and we used existing denture coping for fabrication of pontics... we and our patient were very happy with the outcome... thank you”
